WATERFURNACE HAS A SMARTER WAY TO HEAT YOUR HOME

Wouldn't it be nice to set the temperature of your house based more on comfort and less on your bank account? As the temperatures drop and the price of fossil fuels skyrocket, homeowners around the world are finding that a WaterFurnace geothermal system is a smart way to **reduce your carbon footprint and utility bills at the same time**. WaterFurnace units use the **clean, renewable energy found in your own backyard** to provide **savings up to 70% on heating, cooling and hot water**. It's good for the environment, great for your budget and thanks to a **30% federal tax credit**, now's the best time to act. Visit us at waterfurnace.com to learn more and to find a local dealer.

Michigan Country Lines, USPS-591-710, is published monthly, except August and December, with periodicals postage paid at Okemos, MI, and additional offices. It is the official publication of the Michigan Electric Cooperative Association, 2859 W. Jolly Rd., Okemos, MI 48864.

Subscriptions are authorized for members of Alger Delta, Cherryland, Cloverland, Great Lakes, HomeWorks Tri-County, Midwest Energy, Ontonagon, Presque Isle, and Thumb electric cooperatives by their boards of directors. Subscriptions are \$6 per year.

Postmaster: send address changes to Country Lines, 2859 W. Jolly Rd., Okemos, MI 48864.

Letters to the editor should be sent to the same address. Phone 517-351-6322. Email: gknudtson@meca.coop.

Association officers are **Brian Burns**, PIE&G, chairman; **Ken Swope**, Midwest Energy, 1st vice chairman; **Tony Anderson**, Cherryland, 2nd vice chairman; **Eric Baker**, Wolverine Power, secretary-treasurer; and **Steve Boeckman**, Great Lakes Energy, past chairman.

Craig Borr is president and CEO.

Unsolicited letters, photos and manuscripts are welcome. *Country Lines*, however, will not be responsible for their safe keeping or return.

MANAGER'S MESSAGE

Find a Penny...

As kids, we have all heard the rhyme: "Find a penny, pick it up—all day long you will have good luck!"

As an adult, have you ever walked past a penny on the ground while thinking: "I am too busy. I have too much to do. Besides, pennies are virtually worthless."

I certainly know that I have been guilty of such thinking over the years. Well, recently I did a review of the donations that Cherryland Electric Cooperative (CEC) made in the community from its general funds in 2011 and came to the realization that pennies *can* add up.

The 2011 list of donations from CEC to area organizations is quite long. A quick scan of the list comes up with names like Crystal Mountain Women's Open, Lake Ann Lions Club, YMCA, Copemish Historical Society, Interlochen Eagles, Meals on Wheels, Traverse City VFW, TC Firefighters, Big Brothers Big Sisters, Northern Michigan College, Kaleva Historical Society, Benzie Sunrise Rotary, Grand Traverse Sherriff, and Traverse City Area Public Schools, to name just a few.

When I mention the CEC general fund, I mean dollars that come straight out of the rates we charge. These donations should not be confused with Cherryland Cares dollars that are voluntarily given by members who round up their monthly bills to the nearest dollar. General fund donations are often small amounts ranging from \$100 to \$2,000. Last year, these donations totaled \$14,600.

This may seem like a lot to the average member, but let's consider the fact that gross revenues were \$44,449,000 in 2011. Thus, donations from general funds come to .0004 percent or four one-thousandths of 1 percent. If we get back to thinking about pennies, we can take \$14,600 and divide it by the 34,000 members we serve. This equals less than 43 cents per year per member, or less than 4 pennies monthly

per member. So, you see how pennies really do add up to something useful.

Now, you are probably asking yourself some questions: "Why would a utility with a monopolized service territory spend any money on community organizations? Can't you lower my rates instead?"

Tony Anderson
General Manager

The lowering of rates question is the easiest to answer and the most obvious. The amount is so small that members would not notice whether we lowered their bill by 4 cents per month or not. If we didn't make the donations, it would be easier to give back the annual 43 cents in a future capital credit check.

The monopoly issue is a better question and one that will always be open for good debate. As an electric utility with a defined service territory, technically we are really not in competition with other utilities *until* a vacant piece of land requires service. Depending on the location of utilities, vacant property owners do have some limited options for choosing their electric supplier. In these rare instances, a track record of being a good corporate citizen can be helpful. However, this is not a real reason or excuse for making community donations.

The real reason is the cooperative principle of "commitment to community." Cherryland is here to serve our members and the communities they live in. Donating to causes supported by our members is one way that we can show this commitment.

These donations help to build goodwill with individual members as well as commercial customers. I think the small amount involved with community donations is proof we guard your pennies wisely, but significant enough to show we are responsive to needs beyond just keeping the lights on.

Sharing these pennies across our service territory brings everyone "luck" for far more than just one day.

Her First Paintings Were With Toothpaste

Cherryland member is now an award-winning artist. **Al Parker**

Artist Angela Saxon looks up briefly from her latest oil painting, gazes out a window over the snow-covered Leelanau County landscape, and says she knew early-on that she wanted to devote her life to art.

“Oh yeah, I was an art kid,” laughs Saxon, who grew up in Gary, IN. “Art was always in our lives. My parents had a life membership in the Chicago Art Institute and both were very creative. We always had sketchbooks. It was just a part of my life.”

And, she started her art career in an interesting medium.

“I did paintings with toothpaste as a kid,” she recalls with a smile. “And I was also an entrepreneur. I took Elmer’s Glue and put color in it and sold colored glue.”

Since those early Colgate-on-cardboard days, she’s become an award-winning landscape artist whose oil works hang in collections and galleries across the country. At the recent Northwest Michigan Regional Artists show at the Dennon Museum in Traverse City, Saxon’s “The Sky Above the Lake” was a \$250 award-winner.

“Angela is celebrated as one of northern Michigan’s best landscape artists,” says Sue

Ann Round, owner of the Michigan Artists Gallery in Suttons Bay, where several of Saxon’s works are on display. “Her brush strokes are unmistakable, as she beautifully executes the broad expanses of our beloved land and waterscapes.”

Saxon’s works can also be found at Gallery 50 in Traverse City, as well as galleries in Douglas, MI, Cleveland, OH, and Atlanta, GA.

Saxon and her husband have been Cherryland Electric Cooperative members for 25 years since moving to Leelanau County in 1987. In 1996, they built their home on Watkoski Road and later added the freestanding studio where she works.

Almost all of Saxon’s lush landscapes are done “plein air”—on-site in the outdoors—and many capture the beauty of Leelanau County.

“I begin all my paintings direct from the landscape, focusing on expressive movements in nature,” she explains. “I continue to develop the paintings in my studio until the work has reached a very finished level. At this point, I return to what drew me to the scene in the first place, searching for aspects of the painting that are most com-

elling to me.”

But why “plein air”?

“I mostly work plein air,” she says. “It’s often windy, cold, the flies are biting. It’s just where it all starts for me. I can’t work from photos. I can’t explain it, but it’s just so darn exciting.”

When looking at a landscape, Saxon is drawn to specific places within a scene, such as intimate details of light glimmering through a stand of trees, or the

Angela Saxon in front of one of her landscapes.

bands of color that embrace a shoreline.

After high school, Saxon

earned a bachelor of fine arts degree in painting from Indiana University. At IU, she met and married Erik Saxon. Eventually they moved to Chicago, settling in the artsy community of Pilsen. In 1987, Erik suggested moving to northern Michigan.

“It was a bit of a culture shock for me,” says Saxon. “But one of the things I really came to like was the community of artists here. Art is so lonely when you’re just working in the studio or out in a field by yourself. You have to stay connected. I’m involved in a dinner group with other artists and we meet monthly to share a potluck meal and bring works to share. It’s very sustaining.”

In recent years, Saxon has also been working in encaustic—a mixture of beeswax, damar (a resin used in paint) and pigment. This process requires both timing and dexterity.

“The encaustic paint is kept in a liquid state on a heated palette,” she explains. “The artist must work quickly with the warm, melted paint as it dries quite quickly when on the brush and away from the heat. In many aspects it is very similar to my process of working with oils, as it is also built up in layers.”

Each successive layer of the encaustic must be gently heated so it can fuse with the previous layer of wax. Some of the layers are transparent, revealing previous layers. Sometimes a layer will melt right into a previous layer.

“There is certainly an element of chance in this process,” she says. “This keeps the work fresh and exciting for me and hopefully for the viewer, as well.”

For more about Saxon and her work, visit angelasaxon.com.

Letters

Praise for Barb Barton's natural living, Mystery Photo follow-ups, classified ads, and your thoughts on apples. It's all here in your reader letters.

In Tune With Nature

Barb Barton (*February*) is absolutely the most talented person I have ever known. Not only is she a musician, singer and song writer, she is a biologist to boot! She is a defender of nature, the earth, and human rights. If you have a chance to go to her "gathering," GO! You will learn so much about the earth, food, nature, music and compassion—the list is endless. Thank you so much for publishing this article.

— Diann King, *Three Rivers*

I have the privilege of knowing and have worked with Barb Barton. I didn't realize how much she taught me about nature and the woods until I was in the woods without her, telling someone else about what was there. Barb is truly a woman of the earth with great knowledge, and a big heart to boot! Her music? You'll be addicted!

— Nahnie, *Haslett*

Woolsey Photo Is No Real Mystery

I know the January *Michigan Country Lines* Mystery Photo VERY WELL!!! It is Clinton F. Woolsey Memorial Airport, and at one time the building was a creamery for cows.

My mother painted a picture of this building for my son, and he has it hanging in his bed-

Barb is an amazing woman and an inspiration to people to live closer to Mother Earth whether they live in Michigan or another part of the country! Please give more articles like this.

— Eddie, *Gainsville*

room. My sister and her husband own a cottage near this airport.

FYI: Charles Lindbergh and Amelia Earhart both flew here!

— Maureen Buchel, *Howell*

My husband proposed to me there [Woolsey Airport]. As of

Feb. 24, we've been married 23 years.

— Elizabeth Chapelle, *Honor*

Woolsey Memorial Field is one of the most unique airport buildings in the country—it's a classic grass field that has the flavor of a World War II airfield in England. It's a great place to fly into in the summer and use one of the bicycles that are stored there for private pilots and passengers to ride into town. A real throwback to the good ol' days!

— Mark Wilke, *Ellsworth*

The airport, with its grass runway, is the scene every summer for a 'Fly-in Pancake Breakfast' (this year, July 28). The fly-in also hosts a car show and the two events draw a nice crowd.

— Roger & Sandra Parkins, *Suttons Bay*

The Northport Pilots Association and other groups sponsor a fantastic 'Dawn Patrol' around the end of September each year, and all are welcome.

— Robert Evans, *Traverse City*

The north end of the grass runway leads to a beautiful little park on Lake Michigan with a lookout tower. It's a wonderful place to get away and relax!

— Steve & Michele Rambo, *Howard City*

If you enjoy Michigan history as I do, you might like knowing how the subject of the January Mystery Photo came to be. Visit <http://bit.ly/b6Jv5L>

— Charlie Johnston

My 86-year-old father was born and raised in Northport, and the Woolseys are distant relatives. My family has enjoyed many hours at this location over the years!

— Catherine Hall McNalley, *Hemlock*

The cutest airport in the world!

— Elizabeth Black, *Traverse City*

All About Apples

Enjoyed your column about Michigan apples, and wanted to comment on Honeycrisps. Here in Oceana County, we have quite a good supply, as well as the 'daughter' of Honeycrisp, Sweet Tango. If you haven't tried a Sweet Tango yet, get your taste-buds ready! Each September, at the Apple & BBQ Cook-Off Festival in Mears/Silver Lake, Honeycrisp and Sweet Tango run neck-and-neck for 'fan favorite'!

— Gay Lynne Liebertz, *Pentwater*

In 1954 or 55, my family bought a small farm in Rives Junction, MI, and though my dad worked full-time as a conservation officer, he began farming part-time—perhaps as a way to introduce his children to the life he knew growing up.

We had a great yard with two large apricot trees along the driveway, two peach trees, and a pear tree that I spent hours climbing and eating its produce.

My favorites, however, were the apple trees. I ate apples from mid-summer, when they were so bitter they made your face twist up, until they began to soften,

◀ DO YOU KNOW WHERE THIS IS?

Every co-op member who identifies the correct location of the photo at left by **April 10** will be entered in a drawing for a \$50 credit for electricity from their electric cooperative.

Please note that we do not accept Mystery Photo guesses by phone! Email mysteryphoto@countrylines.com, or send by mail to *Country Lines Mystery Photo*, 2859 W. Jolly Rd., Okemos, 48864. Include your name, address, phone number and name of your co-op. Only those sending complete information will be entered in the drawing. The winner will be announced in the May 2012 issue.

The January contest winner is Davina Clark of Traverse City, who correctly identified the Woolsey Memorial Airport north of Northport.

or when a normal person called them 'ripe.' They were the greatest combination of sweet, tart and crisp and have probably gotten sweeter with the passage of decades and the fact I've never seen them for sale at a grocery or fruit stand.

Fast forward 50 years to when my wife and I bought our current property. While leafing through a tree catalog to find fruit trees suitable for our growing zone, I saw an 'heirloom' variety that rekindled memories of those apple trees from my youth. You guessed it—it was a Transparent.

After reading Buda's article, it is apparent I'm not the only long-suffering [Transparent apple] addict. Last year, my tree had it's first and only apple, and true to my past I picked it too early, so can't say if they are as good as I remember. Time will tell, as I hope to have more than one this year. I'd invite you over, but I'm not sure I can bring myself to share yet.

— Charlie McCord

My dad and all seven of his brothers and sisters were fruit farmers in SW Michigan. As a result, apples have always been a part of my life, too.

Shortly after I got married, I planted two apple trees: a Macintosh and a Jonathan. I've taken good care of them ever since [annual pruning, fertilization, periodic spraying] and get a nice crop every year.

My wife makes five or six pies shortly after I pick the apples, and places them [well-wrapped and uncooked] in the freezer. Then, she can quickly bake us a 'fresh' apple pie for most special occasions that arise. Another trick I learned is: The day I pick the apples, I sort out two 2-gallon plastic bags of the 'best,' and after squeezing out the excess air, seal the bags and place them in our basement refrigerator. Each time I hunger for an apple, I remove one or two from a bag, reseal it, and enjoy a fresh apple! When cared for this way, apples will

There are apples for sale today, throughout Michigan, that are... a far better apple than the Yellow transparent ever was.

remain relatively fresh into April of the following year!

— Bert Metzger,
West Bloomfield

I just finished your essay on apples. You really like the apples in your memory! When it comes to today's apples, you: • Don't like the arsenic in seeds • Don't like the wax • Don't like the pesticides • Don't like the cost of the Honeycrisp...

...and all the wonderful gains we have made storing delicious, high-quality apples are not enough, so you suggest apples this time of year 'taste so old' they are from the year before??

I heartily contest your whole perception of today's apples. Why call the article 'An Apple A Day' when you're really saying today's don't measure up to the yellow Transparents in your childhood memories?

There are apples for sale today, throughout Michigan, that are crisp and tasty, and a far better

apple than Yellow transparent ever was.

— John King, King Orchards,
Central Lake

Mike Buda responds: *I still eat an apple-a-day. And, I agree there are more and better varieties now than the old Transparents, but there was a short time before they fully ripened when they were spectacular, and there's no way to duplicate that taste with stored apples.*

Also, I can live with wax now that I know why it's there, and I really think Honeycrisps are worth the cost. But, you'll have to convince me that some apples I buy now aren't over six months old because they sure have an old texture. Thanks for writing.

No More Classified Ads?

I noticed there haven't been any classified ads listed at the back of the magazine. Are you not going to have them anymore?

P.S. — I really enjoy your publication! Articles are informative and things that I can relate to, and the recipes are great! I have used at least one or two of them from every issue.

— Jane Howe

Editor's Note: *With so many cheap, easy ways to sell things online today (Craigslist, eBay), we were receiving fewer classified ads every issue. We made the difficult decision to discontinue the classified ads to make room for more great articles.*

Scholarships Offered

Each year, the Michigan Electric Cooperative Association awards two \$1,000 scholarships to qualifying applicants. Individuals are chosen based on their scholastic achievement and extracurricular involvement during their high school career.

The applicant's parent or guardian must be a member or employee of a Michigan electric co-op, and the applicant must be planning to attend

a Michigan college or school full-time. Selection will be based on grade point average, character, leadership, academic achievement, extracurricular and community activities, and essay response.

Applications are available at countrylines.com; click on "Youth," email tschafer@meca.coop, or call 517-351-6322, ext. 201. Eligible applications must be postmarked by April 6, 2012.

Shop Co-op!

There are over 900 electric co-ops in America. But your local electric co-op is just one type, and there are over 29,200 different co-ops operating nationwide, including many in the ag industry. From dairy to oranges, and almonds to cotton, our farmers know the value of the co-op business model.

The next time you grocery shop, see how many items you can buy that were produced by a co-op.

Starting with produce, pick up some Ocean Spray cranberries or Sunkist oranges, tangerines, grapes or grapefruit.

Then, cruise to the refrigerated cases for eggs — 95 percent of American eggs are produced and marketed by co-ops. Then, get some Land O'Lakes butter, Cabot or Tillamook Cheese. Need a warm drink? Try Equal Exchange coffee, tea and hot chocolate. Finally, grab some Blue Diamond almonds for a perfect pick-me-up snack.

Now that you're done grocery shopping, visit Ace Hardware or True Value for weekend project supplies. Or, replace your old blue jeans with new ones from GAP, Banana Republic, or Guess—they all get their cotton from the Plains Cotton Growers Cooperative's Denimatrix. But first, visit another co-op—your credit union—to make a deposit to cover your purchases.

The co-op business model promotes self-sustainment and local economic growth. Support all our co-ops as we work together to build a better world.

Find a co-op business near you at go.coop.

Cherryland Members Can Serve on Board

Any qualified Cherryland Electric Cooperative member can be elected to serve on the co-op's board of directors.

To be nominated in 2012, candidates can file a petition with Cherryland's administrative assistant beginning the first day of March

meeting, which will be held Thursday, June 14, at Wuerfel Park. This year's directors will represent Grand Traverse/Kalkaska counties plus one at-large position.

Nominees must meet the director qualifications set forth in the bylaws under "Section

The term of office is three years. Two directors will be elected at this year's annual meeting, which will be held Thursday, June 14, at Wuerfel Park.

and up until 4 p.m. on the last business day of March.

Nominating petitions shall be signed by at least 25 active members of the co-op, in good standing, and all signatures must be obtained within 60 days prior to the date the petition is filed.

Nominating petitions shall be in the form prescribed by the board and are available at Cherryland's headquarters in Grawn. The nominating petitions must specify the geographic service area for which the candidate is being nominated.

The term of office is three years. Two directors will be elected at this year's annual

meeting, which will be held Thursday, June 14, at Wuerfel Park. This year's directors will represent Grand Traverse/Kalkaska counties plus one at-large position.

2 of Article III." Any member interested in becoming a candidate is invited to visit the cooperative's office and learn about the duties performed by directors. In the event no qualified candidate is nominated to fill the vacancy of a director whose term has expired, the newly elected board will appoint sufficient directors to fill the vacancies. This election will be by majority vote of the board and must be done within 60 days of its first meeting. Directors elected in this manner will serve until the next annual meeting, when the members will be given an opportunity to fill the balance of the regular three-year term.

What is Operation Round Up?

It's a voluntary program that allows us to round your Cherryland Electric Cooperative bill up to the nearest dollar and donate the difference to our Cherryland Cares program. During the last five years, you have donated \$120,000 from Cherryland Cares to those in need.

CHERRYLAND CARES

Your donations have helped, among others: Father Fred; Michael's Place; Child & Family Services; Freedom Builders; Boots For Kids; Traverse Health Clinic; GT Dyslexia Association; Love, Inc.; Leelanau Christian Neighbors; Third Level; GT Industries; Benzie Christian Neighbors; Children's Bereavement; United Way; Big Brothers, Big Sisters

**Sign up today for Operation Round Up!
See p. 20 to learn more, and how to apply for a grant.**

Fuel Mix Report

The environmental characteristics of Cherryland Electric Cooperative as required by Public Act 141 of 2000 for the 12-month period ended 12/31/11.

COMPARISON OF FUEL SOURCES USED

Regional average fuel mix used		
Your co-op's fuel mix		
FUEL SOURCE	Your Co-op	Regional Average
Coal	77.9%	64.7%
Nuclear	11.6%	24.0%
Gas	5.3%	7.1%
Oil	0.1%	0.4%
Hydroelectric	1.1%	3.1%
Renewable Fuels	4.0%	3.1%
Biomass	0.1%	0.4%
Biofuel	0.0%	0.1%
Solid Waste Incineration	0.1%	0.4%
Wind	3.7%	1.7%
Wood	0.1%	0.4%
Solar	0.0%	0.0%

NOTE: (1) Biomass above excludes wood; solid waste incineration includes landfill gas, and (2) inclusion of long-term renewable (wind) purchase power contract in Wolverine's mix.

Your Co-op's Fuel Mix

Regional Avg. Fuel Mix

EMISSIONS AND WASTE COMPARISON

TYPE OF EMISSIONS/WASTE	lbs/MWh	
	Your Co-op	Regional Average*
Sulfur Dioxide	5.9	8.2
Carbon Dioxide	1,804	2,186
Oxides of Nitrogen	2.0	2.0
High-level nuclear waste	0.0042	0.0083

*Regional average fuel mix data was compiled from Michigan, Illinois, Indiana, Ohio and Wisconsin.

Cherryland Electric Cooperative purchases 100% of its electricity from Wolverine Power Cooperative, which provided this fuel mix and environmental data.

Keeping Lines Clear

Each year, Cherryland Electric Cooperative attempts to re-clear about 15 percent of the overhead power lines serving our members.

Trees growing under or near these lines are a potential hazard. When combined with thunderstorms, high winds, sleet and snow, trees are the most common cause of outages on our system.

Cherryland has a 30-foot easement for our overhead primary lines. We must maintain clearances not only for the reliability of our system, but also to maintain safety for you—the members—and for our employees.

The amount of pruning that is necessary varies, depending on the tree species and the type of power line.

The lines that run directly to your home need to be clear, so the trees and branches surrounding them are normally trimmed. The branches are trimmed away enough so that even if they loaded with snow, the trees will not cause wear on the wire or cause an outage.

Primary lines, which carry heavier loads (7,200 volts), serve large numbers of members and require increased clearances. We attempt to keep trees and branches about 10 feet away from these lines.

In some cases, entire trees are removed. Those trees are either diseased, weak or dying. Some species do not respond well to trimming, and it makes sense to remove the tree at the time we are trimming instead of coming back to remove a dead tree later.

In most cases, brush and limbs smaller than 6 inches in diameter are chipped and hauled away from member's lawns. Larger wood is cut to manageable pieces and left for the property owner.

However, diseased trees create a different issue. Crews will still chip up the brush and limbs, but the chips of diseased trees are left with the property owner for disposal.

Photo – Great Lakes Energy

This year, Cherryland will perform right-of-way maintenance in parts of Benzie, Grand Traverse, Leelanau and Manistee counties. Members will receive a post card if tree trimming will occur on their property. If you have any questions, please call.

In our next issue I will discuss the various pests and diseases that are attacking trees in northern Michigan.

*Jim Carpenter
is line superintendent at
Cherryland Electric Cooperative.*

Cherryland Offers Scholarships

STUDENTS: High school seniors whose parents or guardians currently receive monthly electric service from Cherryland and live in our service area may apply for a \$4,000 college scholarship (\$1,000 for each of four years).

Selection is based on GPA, extracurricular activities, community involvement and/or after school employment. A minimum required GPA is 2.75 on a four-point system. To continue receiving the scholarship, a student must maintain a minimum college course load of 12 credits per term or semester and receive a 2.5 GPA. Students may apply in three ways:

1. Complete the form at right; or,
2. Contact your high school guidance counselor; or,
3. Contact Nick Edson, communications

coordinator at Cherryland, as noted below.

ADULTS: Cherryland Electric Cooperative is offering a \$500 Adult Education Scholarship to one of its members.

The scholarship goes toward covering the cost of a course or courses taken in a calendar year, and will be awarded on the basis of need, grades and community service. It is a one-time award.

Members may request an application by emailing Nick Edson with their name and address to nicke@cecelec.com, calling him at 486-9222, or write to him at Cherryland Electric, 5930 U.S.-31 South, Grawn, MI 49637.

**All scholarship applications are due by
Friday, April 6, 2012.**

Higher Power Costs On Horizon

Growing demand and environmental regulations stress electric rates.

Thirty-five years ago disco was king, personal computers were born, and Americans needed more electricity. To meet this demand, nonprofit, consumer-owned electric co-ops—in partnership with their wholesale power suppliers—built or invested in power plants, mostly coal or nuclear.

Unfortunately, many of these plants may now be forced to make expensive changes to meet increasing environmental regulations—and as electric demand keeps climbing, new generation will be needed to keep the lights on. Some coal-fired power plants may require modifications so severe that it will be more cost-effective to simply shut them down.

Accelerating Factors

Consumers, adding more plugged-in devices daily, already pay more for electricity. The average annual residential electric bill has risen \$263.40 since 2005, with electricity use outpacing efficiency efforts. Despite the recession, U.S. homes on average used an additional 50 kilowatt hours (kWh) every month between 2009 and 2010; retail electricity sales rose 4.4 percent.

Americans aren't the only people using more power; as worldwide energy use grows, resource competition (and prices) shoot up. By 2035, global energy consumption, primarily in China and India, will jump 53 percent from 2008 levels.

In spite of increasing energy needs, 37,600 megawatts (MW) of older coal-fired power plants are slated for retirement by 2018. The North American Electric Reliability Corporation (NERC), the Georgia-based organization charged with overseeing reliability of the electric grid covering the United States, most of Canada, and the Mexican state of Baja California Norte, predicts a worst case scenario of environmental regulations may force coal plants generating up to 54,000 MW of additional power to shut their doors by 2018.

New power plants could offset this loss, with natural gas taking center stage. The National Energy Technology Laboratory, a branch of the U.S. Department of Energy, focused on advancing national, economic

and energy security, predicts 20,000 MW of natural gas facilities will start operating this year, with another 28,000 MW proposed for 2013. A strong breeze from wind project proposals may add 42,000 MW this year and 28,000 MW in 2013—but only if federal production tax credits continue.

Shifting Fuel Focus

While about one-half of the nation's electricity comes from burning coal, co-ops rely more heavily on the fossil fuel—about 80 percent. That's because the majority of

dioxides—compounds formed by burning fossil fuels—dropped at least 67 percent nationally even as electricity use climbed 38 percent. And, the large-scale expenditure isn't over. Another \$4 billion is slated for upgrades through 2021, with the bulk of the money—\$2.18 billion—marked for work this year and next.

Regulation Risks

“Environmental regulations are shown to be the number one risk to [maintaining electric] reliability over the next one to five years,”

Over the last decade, co-ops have invested \$3.4 billion to boost power plant performance and limit emissions. Another \$4 billion is slated for upgrades through 2021.

co-op coal power plants were built between 1975 and 1986, when using natural gas was prohibited by the federal Powerplant and Industrial Fuel Use Act.

Now, a series of U.S. Environmental Protection Agency (EPA) regulations impacting cooling water intake structures, coal ash disposal, interstate transport of air pollutants, and hazardous air pollutants like mercury are affecting all electric utilities. In most cases, co-ops will need to retrofit coal-fired plants with costly pollution control equipment; in others, co-ops could opt for early plant retirements.

“Time is tight—improvements take time and new technologies have to be tested before going mainstream,” says Kirk Johnson, senior vice president of government relations for the National Rural Electric Cooperative Association (NRECA). “We're deeply concerned that EPA's strategy to require significant change within very compressed timelines may be unachievable and could damage the economy of rural America and affect service reliability.”

Seeing the handwriting on the wall, co-ops have taken action. Over the last decade, power supply co-ops have invested \$3.4 billion to boost plant performance and limit emissions. In fact, since 1990, power plant emissions of nitrogen oxides and sulfur

reports NERC's 2011 Long-Term Reliability Assessment.

Why the concern? Because steps required by EPA rules have the potential to cost the industry billions of dollars and don't provide enough time to comply.

“Regulation on top of regulation, and court decision on top of court decision, have compounded the situation to the point that we now have contradictory regulations and court decisions that don't make any sense,” explains NRECA CEO Glenn English. “Our nation needs to adopt a balanced, common-sense approach to environmental protection that factors in electric reliability and affordability.”

NRECA has been actively urging the EPA through comments, testimony and litigation to consider the negative impacts of increased electric power costs on consumers as it continues to move forward with its rulemakings.

Electric co-ops are leading the way to find affordable solutions to America's electricity demand. Find out how you can help at ourenergy.coop. —Megan McKoy-Noe

7 Questions

for Michigan Department of Agriculture and Rural Development Director Keith Creagh.

People might assume you grew up on a family farm. What has kept a city-kid like you in the agriculture industry for over 35 years?

I enjoy working with people who make their living from the land. They're salt-of-the-earth people who work hard and aren't afraid to tell you just exactly what they think.

What does your quote 'agriculture is more than just cows and plows' mean?

MDARD is involved with all kinds of things people don't traditionally associate with agriculture. We oversee everything from ag business development to certifying the scales for pharmaceuticals, gas pumps and trucks, regulating county fairs, and international exports.

Last year, Gov. Snyder signed an executive order officially adding "rural development" to the Dept. of Agriculture's mission. Will this focus lead to more jobs for rural Michigan?

Our role isn't to create jobs, but to create an environment where businesses can flourish and create jobs on their own. We help them create this environment by bringing groups and resources, such as bankers, realtors and others together with the Ag Department and other sectors. It's a fun, collaborative environment to be working in!

Gov. Snyder has also said that rural economic development is a key focus for his administration—particularly in agriculture, mining and exports. What is your role in this?

The governor is serious about reinventing Michigan, and we're

having some good conversations about projects that will boost rural communities, businesses and the economy. Land-based industries need to be part of the state's rejuvenation. Sustaining the state's food processing plants and other businesses is crucial.

All state departments need each other—whether it's health, housing, tourism or agriculture—to help determine what's needed to reinvent Michigan and how rural communities can be involved. This means renewed cooperation among state departments to solve business problems.

Tell us some success stories about how the MDARD is benefiting rural businesses and communities.

We're partnering with the governor and the Michigan Economic Development Corporation on a plan that provides Asian food companies with healthy foods while promoting Michigan food exports—especially fruit. In fact, we run an export program that partners with foreign ag services around the world, and locally.

We also assist Michigan companies with other high-end marketing and exports, such as working with the Johnson & Johnson company, of Zeeland, to provide a new baby formula for infants in China.

Other projects involve everything from "Project Fresh"—helping farm markets develop electronic readers they can use

to accept Michigan Bridge Cards (debit cards issued to Department of Human Services clients to buy certain food products)—to providing food safety and science engineers to help establish a dairy plant in Coopersville.

We have helped Cherry Central Cooperative (Traverse City fruit grower/processor) develop new markets in France; Mastroianni Produce (Livonia gourmet vegetable grower) with bulk fertilizer storage and increasing their productivity.

We also work with food processors on logistics at the farm gate, including farm and pesticide safety, registering products, sorting out federal rules, and defining technology and expertise that gets projects moving.

What efforts are you most excited about?

There's just something happening in Michigan—we're iconic food processors with a water resource and value chain that is envied worldwide. But now our business expertise is also drawing the attention of foreign companies.

We've helped 22 companies with first-time food sales overseas. Exports in 2010 were \$1.75 billion in food and ag products, with top markets being Canada,

China, Japan, Mexico, South Korea and Taiwan. These exports boost farm prices and income while supporting 14,700 jobs.

There's renewed interest in developing the U.P. mining and forestry industries. We're working on the best tax structure, rewards for local people, and supporting needs, like access to workers with advanced degrees—all things that make a community prosperous. Of course, energy is front and center in those conversations.

There's also more optimism—a new and exciting little pulse beating in Michigan that is relationship driven, and we are working with rural communities to increase their success.

Michigan Country Lines magazine has been featuring Michigan-made (or grown!) products. What is your favorite?

The things I love most about Michigan aren't physical things. I remember driving over the Mackinac Bridge with my son one fall day at sunset and asking him, 'is there anyplace else you'd rather be?' But as far as actual Michigan-made products, I would say fresh fish from Krueger's Fish Market in Mackinaw City is at the top of my list. Couple it with asparagus, a Michigan wine and Hudsonville Ice Cream, and you have a pretty nice meal. And, the Stormy Kromer hat gets an honorable mention!

THE CREAGH FILE:

- Raised in Detroit, earned a B.S. in forestry from Michigan Tech. Univ.
- Retired after 33 years at the Michigan Dept. of Agriculture, serving as chief deputy director, and pesticide/plant pest division director.
- Worked as industry affairs director for Neogen Corp., 2007-2011.
- Appointed by Gov. Snyder to return to MDARD as director in 2011.

Valerie Donn's Garden Art

Photo – Sarah Brown Photography

If you could stand among Valerie Donn's tulips this spring, you'd see a handmade birdbath whose design was inspired by the leafy reach of her rhubarb plant. And nearby, hidden under the sweet scent of catmint and its leaves, you would find a whitetail fawn painted into the curve of a stone. Farther up, there's a birdhouse with a family of raccoons handpainted in welcome.

It's these details that tell you Donn's garden is not just soil and seed. This place is hers, a place where her art and garden complement each other, one growing from the other.

Donn lives with her husband Ted in Williamsburg (and Hessel in summer, where they are Cloverland Electric Co-op members), and is mostly a self-taught artist who had her first success in high school.

"I remember my high school art teacher telling me to stay with it, to keep going with my art," she says. "Those words stayed with me." That year, she won an award for one of her sculptures. From there, she took one art course in college before life brought with it a family and a career.

"I had a full-time job and two children who, of course, loved to interrupt me,"

Donn says with a laugh.

As her schedule became tighter, her art had to

wait. But once her children, Heather and Corey, were grown, she picked up her interest in art again. She started researching techniques and tools by checking out library books on art. Next, she took a decorative painting class.

"It was cutesy stuff," she says, "but I wanted to do more, do different things."

It wasn't until she took a workshop from Rod Lawrence, a well-known wildlife artist in Kalkaska, that she finally found her pace.

"I started learning how to draw animals, their fur, things like that. It was so inspiring," she says. "He really emphasized painting what you liked, things you were drawn to."

Donn soon started creating better, more detailed garden art, along with paintings like those of Roxie, her pet Pug, and of her son at a young age holding his father's hand.

She soon found herself experimenting with sculpting again, too—like the day she broke the lid of her ceramic olive oil bottle. Instead of tossing it, she sculpted a piece of clay into the shape of a playful woman, painted her with grapes in-hand, and topped the bottle herself.

Today, Donn is still learning as an artist and trying new things in her garden each summer.

Her artwork can be found at a handful of area craft shows, but she sells most of it by word of mouth. (She was once commissioned to hand-paint rocks for a sports bar!).

Outside her garden and art, she is a special events planner at PAEM Solutions, a division of Passageways Travel in Traverse City, and can be reached at tvdonn@yahoo.com.

Photos Courtesy--Valerie Donn

Create Your Own...

Artist Valerie Donn encourages you to release your inner artist and create your own garden art. "Most people say, 'I can't do this!' but they would be surprised," she says. "Adding one small personal detail turns even a store-bought item into art."

Go online. Donn's favorite website is etsy.com, a snappy marketplace of homemade and vintage items from around the world, where she cruises for ideas and inspiration. "If I find something I like, I try it," she says. "It's fun to see what others are doing or, sometimes, to see if I'm doing something no one else is."

Hit the books. Donn visits the library and scouts out painting and photo books. If she finds something she likes, she makes a color copy to reference later, and paints pictures based on them.

Try it all. Consider working with stone, wood and/or glass. Looking at Donn's varied collection confirms that there is no one "way" to create.

Go simple. Use stencils, Donn says, to make a store-bought purchase your own. One of her projects was a plain, wooden birdhouse bought from the store. She painted it, then stenciled it. Voila! A one-of-a-kind, personal touch to her garden.

Buy the right paint. Donn purchases outdoor paint from craft stores like Michaels and Jo-Ann Fabrics & Crafts in Traverse City. "Outdoor patio paint won't fade," she says. "I have projects that have stood outside for years that haven't lost their color."

Protect it. Spray a clear finishing coat for the final touch on any outdoor project. Donn uses Krylon® acrylic clear coating, also from the craft store. "Be sure to get the non-yellowing outdoor coating," she says. This is key to keeping your craft in its original condition over the years.

Corn Is King

To get the best taste explosion from sweet corn, you need to grow it yourself. That way, you can “get the pan boiling and go pick the corn.” It doesn’t get any fresher than that, and regardless of where you live in Michigan, you can grow sweet corn. Here are some tips to get you planning your crop now, so you can enjoy the ultimate sweet taste of summer later.

Variety Selection

Sweet corn has been cross-bred more than most vegetables. Breeders are always seeking ways to make it sweeter, bigger and more disease resistance. There are four ways to classify sweet corn in regards to sugar content: normal sugary (su), sugary enhanced (se) and (se+), synergistic, and super sweet (sh2) (see yellow box for descriptions).

The goal is to choose a variety that both meets the approval of your taste buds and can be grown successfully in your area, based on the growing days listed on the packet. These refer to the number of *good* growing days available in your area. For example, if you have up to 75 days of warm weather, nights averaging in the lower 60s or better, then choose a variety that requires 75 days to maturity or less.

If you garden south of Gaylord, you’re most likely in zone 5 and should have from 70-85 good growing days. Select your sweet corn variety accordingly. One of the sweetest I remember from growing up in the Thumb area is Illini Sweet Corn (sh2) (Burpee.com), an 85-day variety that produces very large, sweet ears. It holds its sugar content well, even if you don’t cook it right away after picking it. Kandy Korn EH Yellow (se) (jungseed.com) is another 85-day variety, and a favorite among Jung customers. Of course, there are other varieties for southern Michigan growers, some that don’t require as long a season, such as the popular Ambrosia Bicolor (se) from Jung’s and Sugar Buns (se+), a 70-day, easy-to-grow variety from Johnny’s Selected

CORN TYPES: *What’s the Difference?*

NORMAL SUGARY (su) • Traditional corn flavor, sugar turns to starch quickly after harvest.

SUGARY ENHANCED (se) and (se+) • Increased tenderness and varying sweetness.

SYNERGISTIC • Comprised of 75% se and 25% sh2; combining tenderness with super sweet.

SUPER SWEET (Sh2) • High sugar content, slow to turn to starch after picking.

Photos - © iStockphoto.com

Seeds (johnnyseeds.com).

For northern gardeners, there are a few varieties that will do just fine in our cold belt, providing you follow the growing tips below. The varieties that have preformed consistently for me are Northern Extra Sweet Yellow (sh2), 67 days, and Early Xtra Sweet Yellow (sh2), a 68-day crop. These may produce a little smaller ear than the ones noted above, but they’re just as tasty.

Planting

Corn is a sun-loving crop that performs best over a long, hot summer. It is also a big feeder, so have an organic or inorganic fertilizer to use.

Plant your corn in fertile, well-drained soil. A slightly sandy soil is fine as long as you’ve added copious quantities of well-rotted

manure or aged compost. And, planting seeds directly in the soil often works better than using transplants.

Consider ordering seeds that are coated with a fungicide, especially if your soil is slow to warm up in the spring. Corn should be planted no later than June 1 to have time to ripen. Plant in blocks of at least four rows side by side, to ensure good pollination. Most varieties need to be separated from others by at least 25 feet to avoid cross pollination, which can result in changes in starch and sugar.

As the seedlings emerge, fertilize lightly with an all-purpose liquid or low nitrogen organic fertilizer, such as Milorganite. Side-dress the plants about every two weeks with an organic or inorganic plant food. Take care not to apply too much nitrogen, and avoid direct contact with the roots. Water during dry spells and keep the rows properly weeded and cultivated. Also, thin the plants to at least 8 inches apart, as this move alone will help ensure ripe ears.

The three problems that seem to plague sweet corn are the ear worm, which bores directly into the ear, corn smut, and raccoons. Crop rotation can prevent the first problem from becoming endemic, but if these become a serious problem, treat with *Bacillus thuringiensis* (Bt). Raccoons can be a serious matter since they come around to spoil the party just as the ears are turning yellow. The best defense against raccoons has proven to be the tall woven fence that surrounds my garden.

Now, it’s time to get eating. When the pot comes to boil, drop the shucked corn in for no more than three minutes. Sweet corn also tastes great in corn fritters and freezes real well, giving you the fresh taste of corn all year long.

Neil Moran is the author of “North Country Gardening with Wildflowers: A Guide to Growing and Enjoying Native Plants in the Upper Great Lakes Region.”

A Corn Chip Worth Eating

Michigan-grown FarmBoy products are a tasty, organic harvest.

Corn. You can see it growing from spring to fall—those thick green leaves waving to us in the wind until they turn crispy gold and fly away. But did you know there are over 11,000 corn farmers in Michigan whose labor contributes over \$1 billion per year to our economy?

The corn products you're probably most familiar with—fresh on the cob, frozen, canned, popcorn, and corn syrup—represent only a fraction of what is made with corn.

Another popular corn product is tortilla chips, and there are actually several producers in Michigan. One is in North Branch, and was nominated by *Country Lines* reader Cathy Isbell.

“Our favorite Michigan-made product is FarmBoyTortillaChips...made on the Simmons family farm,” says Isbell, a member of Presque Isle Electric & Gas Co-op.

The farm's current owner, John Simmons, started working alongside his dad and uncle when he became big enough to ride a tractor. Now, at 56, he runs the 150-year-old farm under the brand names of FarmBoyTortillaChips and FarmBoyFlapJacks mixes, with help from his own family, especially daughter Stacey, who helps with the business side.

In the early '90s, seeing demand for organic food on a steep rise, John decided to focus the entire farm on diverse organic production. Today, FarmBoyFlapJacks mixes and the heirloom corn that became FarmBoyTortillaChips are made with organic grains.

“Much of the planning was similar to the planning involved in farming—projections of ingredient needs, costs versus projected revenues, storage requirements, and cash flow versus expense flow projections,” he says of the transition. “Some new considerations were packaging, label creation, promotion of products, and public relations.”

FarmBoyTortillaChips are packaged in unpretentious brown paper bags with white stickers illustrating John himself, and exclaiming “Heirloom Corn!” and “No GMO.”

But, what he loves most about running his business is the people. “I love the interaction with people—retail store owners, restaurant owners, cooks/chefs, wait-staff, consumers—every person who tastes the food I've grown and prepared, and reacts with an expression

John Simmons is the owner of FarmBoyTortillaChips in North Branch.

of surprise, satisfaction and joy!”

“Much of what I've found leading to success in my food business may be contrary to industry norms,” he adds. “I have an unusual product line, and as an innovator, I've just had to ‘figure some things out’ through trial and error.”

John is happy to talk details about his corn chips, and he is not a bystander in their production. “We use open-pollinated heirloom corn, which gives our chips an amazing depth of flavor,” he explains. The corn is then parched and prepared into homestyle tortilla chips that are fried in organic sunflower oil.

For the future, he continues, “I hope to expand production and provide delicious wholesome food to as many people as I can.”

FarmBoyTortillaChips are sold in over

50 stores throughout the state, and now in Illinois and Kentucky. Chip varieties include Celtic Sea Salt, Lime, Garlic, Jalapeño, Cracked Black Pepper, and Holiday Spice. To find a store near you, visit farmboytortilla-chips.com or order directly from the website.

“My favorite chip person who I meet at food shows is a person that says, ‘Oh, I don't eat corn chips,’” John laughs. And he responds, “Well, perhaps you've never had a corn chip worth eating!”

Writer Jodi Bollaert is a lifelong Michigan resident and enthusiastic locavore (person interested in eating food that is locally produced, not moved long distances to market). Find more wonderful Michigan-made products on her special listing at [facebook.com/favoritemichiganproducts](https://www.facebook.com/favoritemichiganproducts).

Tell us about your favorite, or a unique, Michigan-made product. Email your submission to czuker@meca.coop or send to: *Country Lines*, 2859 W. Jolly Rd., Okemos, MI 48864. Be sure to share why you like it, or a unique story to go with it.

Tech Tips for Tots

Modern technology tools help us learn anytime, anyplace.

No area has greater potential to transform the lives of children than education. And no technological innovation in our lifetime has greater potential to transform education than broadband internet. That's a message from more than 150 rural education and technology experts who participated in a National Rural Education Technology Summit in July 2011.

Paired with mobile devices like the iPad, the internet is expanding access to more teachers and lessons—which can be a big boost for rural communities. Modern technology can make learning more personal and engaging, and it can turn a remote schoolhouse into a global community of learners.

Technology can also turn a grandma into a liar.

In my defense, the child's mother made me do it. She claimed the only way to get my grandson to nap during a recent road trip was to pretend my iPad batteries had died. Since a tired 2-year-old is no one to mess with, I played along.

Not everyone approves of computer use for children under age 3. Critics prefer toddlers to learn through their bodies, first mastering developmental skills such as crawling, walking, talking, and making friends.

Try telling that to a toddler trapped in a car seat—especially after he's saved a story with "Super Why," and actually made "the wheels on the bus go 'round and 'round'" (over and over, and over again).

The truth is, tablet computers like the iPad change the technology game considerably. The big screen, touch interface, and fun learning apps make it a child magnet, prompting both *ComputerWorld* and *The New York Times* to call the iPad the "toy of the year" in 2010.

Rural Learners Gaining Ground

The benefits of educational technology for school-aged children are even greater. And in rural schools, technological developments are helping to launch students into the outside world.

Just look at the payback from online learning alone—for learners of any age.

- **Unlimited access:** Students gain knowledge and information from recognized experts at a minimal cost.

- **Flexibility and convenience:** Online learning is available 24/7. This flexibility makes it possible for learners to take breaks for work, sports, travel, or even child care.

- **Job-readiness:** The workplace is going progressively digital. E-learning has made it possible to acquire digital literacy skills.

- **Mobility:** The learner does not need to commute every day to gain knowledge.

- **Accessibility:** The learner can access information from any location with an internet connection.

Lack of Connectivity Still Limits Results

In too many rural communities, however, lack of connection prevents students from joining the technology revolution. For many rural districts, infrastructure, including little or no access to broadband or the internet, is among their biggest problems. The 2011 report, "Bringing Broadband to Rural America" (available at fcc.gov), revealed 28 percent of rural Americans lacked access to broadband, compared to 3 percent who lack access in non-rural areas.

Rural schools are also less likely to have full-time tech-savvy leaders, with only 36 percent of rural districts reporting they had such staff members compared to 79 percent of city districts, according to a 2008 U.S. Department of Education report. Twenty-three percent of rural districts didn't have any sort of technology leader.

There is hope on the horizon. Connect

Michigan (connectmi.org) has partnered with the Michigan Public Service Commission to engage in a comprehensive broadband planning and technology initiative as part of a national effort to map and expand access to high-speed mobile broadband service across rural Michigan. They have a champion in President Barack Obama, who has set a national goal of ensuring 98 percent of Americans have broadband internet access within the next five years.

And a handful of technology-related partnerships are developing between rural districts and universities, such as Vanderbilt University's Aspirnaut program, which includes a "one-room school on wheels" where students use laptops to work on STEM (science/technology/engineering/mathematics) content during lengthy bus commutes.

Which brings me back to that road trip. Once my little back-seat buddy nodded off, I slipped out my "sleeping" iPad to help pass the time. I'd no sooner flung my first angry bird when I heard a sleepy, "Hey, what you doin,' grandma?"

I was so busted.

Start early, start smart

It's up to adults to keep children safe online, and select software and settings that fit the way young children develop and learn.

KEEP IT SOCIAL – Allow children to work together at computers, they'll gain social and communication skills.

KEEP IT IN BALANCE – Limit screen time; allow for plenty of active play.

SET THE STAGE – Technology should be included in the main learning area, rather than in a separate room, so it can be monitored, and adults can comment on what's happening. Hide wires and keep the screen free of glare.

MAKE LEARNING KEY – Researchers agree, software for young children should:

- Encourage exploration, imagination and problem solving
- Reflect and build on what children already know
- Involve many senses and include sound, music and voice
- Be open-ended, with the child in control.

Resources

- ◆ netc.org/earlyconnections – Tips for using computers in learning at all ages.
- ◆ childrenandcomputers.com – Software and websites appropriate for young children.
- ◆ connsensebulletin.com – Includes tips for children with special needs.
- ◆ pbslearningmedia.org – Thousands of classroom-ready, digital resources, even in-depth lesson plans. PBS LearningMedia™ is free for educators.

Source - Scott Bauer/USDA

The deadly parasitic Varroa mite on the back of this honey bee is one of many pests the U.S. Department of Agriculture is trying to combat without harming the bee.

Guarding the Honey Bee

Honey bees have existed for millions of years and supplied honey for the human race since the Stone Age, but there is great concern that their benefits to the world will be diminished, if not lost. However, with a little help from homeowners and other concerned citizens there is hope for their future—and ours.

These amazing and almost mythic creatures have a highly developed social structure that has helped sustain humankind and human society.

Once thought to be native to South Asia and the South East Asia subregion, recent studies indicate honey bees may also be native to Africa and probably all continents except North America. Cave drawings also indicate that early humans recognized the value of honey.

As humans learned to domesticate honey bees the art of beekeeping grew, and today they also provide us with beeswax, propolis (a bee glue used in cosmetics and health supplements) and pollination services.

Though several species exist, only two have been domesticated (the Egyptians were among the first to do so), and only one (*Apis mellifera*) is used extensively for domestic honey production and pollination.

An average well-managed domestic hive will hold 50,000 bees (sometimes as high as 80,000) in mid-summer. Bees from one hive can gather up to 80 pounds of pollen, and produce well over 100 pounds of honey annually.

Honey bees generally visit flowers to collect pollen, their source of protein, and in the process are responsible for about 80 percent of all insect pollination. This service is valued in the billions of dollars, and without it many commercial and home-grown food crops would be greatly reduced.

In 2007, honey bees made the news

because a disturbing number (30 to 70 percent) of North American European hives collapsed. This sudden, unprecedented decline was named colony collapse disorder (CCD). Researchers have not found a specific cause, but many scientists suspect a combination of factors rather than a single pathogen or poison. This may include loss of habitat, changes in agricultural practices, new viruses and pathogens, extreme weather during the past decade which resulted in impaired protein (pollen) production, and the possible synergistic effects of any combination of these factors.

A decline in beekeeping is another contributing factor to the population decline that has been taking place since the 1950s, notes Tim Tucker, a member of the American Beekeeping Federation's Membership and Marketing Committee and editor of ABF's E-Buzz newsletter.

"For many years the cause of decline was economic in nature and tied to the availability of other sweeteners on the market," he explains. Access to inexpensive sugar and high fructose corn sugar (HFCS) has caused many people to stop using honey as a home sweetener.

"With relatively cheap sweetener prices, we no longer consume much honey on a per-person basis—less than 2 pounds per year," he said. "On the other hand, we consume more than 100 pounds of refined sugars and HFCS per person and some estimates are much higher than that.

"This caused honey prices for many years to stay so low as to make it difficult to make a living and many commercial beekeepers gave up their operations," he adds.

Compounding that problem are the health issues of honey bees. "In the last 20 years we have had two new parasitic mites come into the country, and the varroa mite vectors

as many as 17 to 20 different viruses that affect honey bee health," he continues. This has increased the cost of keeping bees alive, resulting in additional beekeepers giving up this important work for jobs in other fields.

"Without a corresponding rise in pollinating fees over the past 15 years or so, many of the larger beekeepers that are still in existence would likely have gone out of business as well," Tucker says.

Though research indicates that the use of chemicals in home gardens and landscapes has not contributed to CCD, Tucker says homeowners can still help protect these amazing and economically important creatures.

"The main thing homeowners can do is provide plantings of beneficial flowers that bloom during the full season to provide nectar for honey bees and all native pollinators."

"The second thing is to educate the public to accept a lower level of perfection in their yards and gardens and use less herbicides and pesticides that can affect pollinators," he continues. "It is not a good thing to treat our lawns to remove clovers and even dandelions that provide nectar to bees. While it makes for a less perfect looking lawn, it is more natural and beneficial to the bees."

According to Tucker, white clovers and native wild flowers, trees and shrubs that provide lots of pollen and nectar are wonderful additions to yards and landscapes. Shrubs such as spirea, currants, blackberries, blueberries and even honeysuckle are great choices. Beneficial trees include all fruit-producing and ornamental varieties such as Bradford pears and black locusts.

Homeowners certainly can take up beekeeping themselves. Courses are available in every state, often through local beekeeping associations and Cooperative Extension units. If beekeeping is not feasible, homeowners can still help by providing locations for beekeepers to place bees—especially on the outskirts of towns and suburban environments, but also in the countryside, Tucker says.

So, what's the course of action if a swarm of honey bees show up on its own? Because they can pose a threat to people and animals, and because the swarm may be the more aggressive strain of Africanized honey bees, Tucker suggests calling a local beekeeper to have them removed.

To learn more about honey bees and beekeeping, visit the ABF site at abfnet.org or contact a county or regional Cooperative Extension office for sources of local information and help.

— Tim Tucker

Meatless Meals

You don't always need meat to create a tasty dish. These meatless recipes are flavor-filled and sure to fill you up. They're so delicious even meat-eaters won't miss a thing.

Visit countrylines.com for hundreds more reader recipes.

Margherita Pizza

- 1 T. olive oil
- 2 T. pizza sauce
- 1 pre-made whole wheat or white pizza crust
- 3/4 of 12-oz. jar diced tomatoes, drained
- 2 T. sliced yellow (mild) peppers
- 2 T. chopped fresh basil leaves
- 8 ozs. shredded mozzarella cheese

Preheat oven to 450° (or directions on crust package). Mix olive oil with pizza sauce and spread evenly onto crust. Add tomatoes, peppers, basil and cheese, making sure all ingredients are evenly distributed around crust. Bake for 12-15 min or until desired crispness.

Teriyaki Turnovers

- 16 oz. pkg. frozen Athens Fillo Dough, thawed
 - 1 T. olive oil
 - 1 stalk celery, finely chopped
 - 1 sm. head broccoli, finely chopped or 10-oz. pkg. frozen, chopped
 - 5-oz. can water chestnuts, finely chopped
 - 6 T. teriyaki marinade or sauce
 - 1 bunch chopped green onion (save 2 stalks, also chopped, 1 for dipping sauce and 1 for garnish)
 - 3 ozs. roasted cashews (2 ozs. chopped and 1 oz. finely minced for garnish)
 - 1/2 c. butter
- Dipping Sauce:**
- 1/4 c. Swanson vegetable broth
 - 1/4 c. teriyaki marinade or sauce

1 T. chopped green onion
2 T. Asian (Lee Kum Kee) Chili Garlic Sauce

Set oven to 375°. Sauté celery in olive oil until slightly soft. Add broccoli and water chestnuts and sauté for 3 more minutes; drizzle with 4 to 6 tablespoons teriyaki sauce. Mix in 2/3 of raw green onion and 2 ounces cashews. Set aside.

Heat 1/2 cup butter in a small microwaveable bowl until melted (approx. 20 sec). Brush very thin layer onto 1 sheet of dough, repeat adding a second layer, and third if desired. (You must keep dough you're not using from drying out by placing a wet and wrung paper towel on top until ready for next sheet. Work quickly so dough doesn't dry out and crumble.)

Add 1/4 cup of broccoli mixture placing in

Olive and Mozzarella Orzo

Margherita Pizza

the bottom corner of dough. Fold the empty side over then continue folding into a large triangle. Place on cookie sheet lined with parchment paper and repeat process until broccoli mixture is all used. Makes about 6 turnovers. Bake for 15 min and serve with dipping sauce.

Mary Gorshe, Suttons Bay

Grilled Tuscan Salad on a Stick

Place any combination of the following on a skewer:

- colored bell peppers, cut in pieces
- cherry tomatoes
- zucchini, cut in rounds
- summer squash, cut in rounds
- mushrooms
- artichoke hearts
- onions, cut in chunks

Grill the vegetables and place on a bed of greens, such as Romaine or baby leaf lettuce.

Tuscan Salad Dressing:

- 3 T. mayonnaise
- 1/3 c. red wine vinegar
- 1/2 c. water
- 2 t. lemon juice
- 2 T. parmesan cheese
- 3 T. olive oil
- 1 sm. clove garlic, minced
- 1/4 t. dried oregano
- 1/4 t. dried basil
- 1/4 t. thyme
- 1/8 t. black pepper

Combine ingredients in a blender and drizzle over the salad.

Julie Dennison, Roscommon

Olive and Mozzarella Orzo

- 1 lb. orzo pasta
- 1 1/2 c. chopped onion
- 2 T. olive oil
- 2 T. butter
- 2 c. chopped celery
- 2 T. flour

- 1 c. water
 - 1 t. chicken bouillon
 - 1 28-oz. can tomatoes, drained and chopped
 - 1 t. basil
 - 1 t. oregano
 - 1/4 t. cayenne
 - 1/2 lb. pitted Kalamata olives, chopped
 - 3/4 lb. mozzarella cheese, cut into 1/4" pieces
- Cook orzo till almost done, drain and place in large bowl. Cook onion in oil and butter over medium-low heat, stirring until soft. Add celery and cook; stir for 5 min. Stir in flour and cook 3 min. Stir in water, bouillon, tomatoes, basil, oregano and cayenne. Simmer 5 min. Stir into orzo with olives, 1/2 lb. mozzarella and salt to taste. Transfer to 2-qt. casserole. Cut remaining cheese into strips and arrange decoratively on top. Bake at 400° for 30 min, or until heated through.

Vicky Hueter, Lovells

Galuski

- 1 med. head cabbage
 - 1/4 c. butter
 - salt to taste
 - pepper to taste
 - generous dash paprika
 - 1 8-oz. pkg. Kluski noodles
- Shred cabbage finely. Melt butter in large skillet; add cabbage with salt, pepper and paprika. Cook noodles in boiling salted water until tender; drain. Mix with cabbage and fry until brown.

Janice Harvey, Charlevoix

Mock Tuna Salad

- 2 15-oz. cans garbanzo beans
- 1 red bell pepper, finely chopped
- 2 carrots, peeled and finely chopped
- 2 celery stalks, finely chopped
- 1 med. onion, finely chopped
- 2 T. finely chopped fresh cilantro
- 1 c. chopped walnuts
- 1 T. dijon mustard
- 3/4-1 c. mayonnaise
- salt and pepper to taste

Drain garbanzo beans. Mix in food processor until flaky. Combine all chopped vegetables with beans by hand. Mix mustard, mayonnaise, and salt and pepper together and add to bean/veggie mixture. Serve as sandwiches.

Geralyn Guild, Grand Ledge

Squash Bisque (Pictured above)

- 1/2 c. chopped onion
- 2 T. grated fresh ginger
- 1 T. olive oil
- 3 c. cooked, peeled butternut squash
- 3 c. vegetable broth
- 1 c. evaporated skim milk
- 1/8 t. nutmeg
- salt and pepper to taste

Sauté onion and ginger in olive oil, then stir in squash and broth. Cook 5 minutes, and then puree in blender. Return to saucepan and add remaining ingredients, heat until hot. Serve with hearty bread and a good salad.

TCAPS superintendent Steve Cousins receives an EO check from Cherryland's Kevin Cragg.

Cherryland's Energy Optimization Helps TCAPS

Kevin Cragg, Cherryland's member service manager, presented Traverse City Area Public Schools superintendent Steve Cousins with an Energy Optimization (EO) rebate check in the amount of \$1,539.56 for energy saving projects completed in 2011.

Traverse City schools served by Cherryland are: Blair, Cherry Knoll, Courtade, Interlochen, Silver Lake, Westwoods, East Middle School, Traverse City High School and West Senior High School. The qualifying projects included new energy efficient lighting and controls in the Traverse City High School gymnasium, as well as the installation of Vending Misers – an electronic control that significantly reduces vending machine energy use.

West Middle School science teacher Heather Wares had her students verify the energy savings by monitoring vending machines with and without the Vending Misers. The students confirmed that the Vending Misers reduce energy use by about 40 percent, and these units have now been installed at all TCAPS buildings.

Annual Meeting Set for June

Cherryland Electric Cooperative's 74th Annual Meeting will be held Thursday, June 14, 2012, at Wuerfel Park.

The Traverse City Beach Bums, of the independent Frontier League, play their home games at Wuerfel Park, which gets its power from Cherryland.

Cherryland's business meeting will run from 5-6 p.m., followed by the Beach Bums home game at 7:05.

Members who attend the game will receive a free ticket and a coupon that entitles them to a ballpark dinner—a hot dog or brat, chips, and a soft drink.

More details about the annual meeting will be upcoming in *Country Lines* magazine.

Cherryland Cares Seeks Grant Apps

Area nonprofit agencies who are seeking financial help can apply for a grant through Cherryland Cares.

Cherryland Cares is a five-member board, made up of Cherryland Electric Cooperative members, who distribute money from Operation Round Up to area nonprofits. The board's next quarterly meeting is Monday, March 19. The deadline for applications is Friday, *March 9*.

Operation Round Up money comes from Cherryland members who volunteer to round up their bills to the nearest dollar every month. This amount averages \$6 per year.

To receive a Cherryland Cares grant application or to join Operation Round Up, contact Nick Edson at Cherryland. His direct line is 486-9222 or email him at nicke@cecelec.com.

Member Input Session Set For March

The next Cherryland Electric Cooperative quarterly member input session is planned for March.

Co-op members can address the board of directors at 9 a.m. on Mon., March 19, at the start of the regular monthly meeting. Each member has up to three minutes to speak to the board.

Following the March member input session, the next one is scheduled for Monday, June 18.

And the Oscar Goes To...

Photo - Jesse Donald, 1961

You probably thought that the Academy Awards season was over when the Oscars were handed out in late February. Well, the first Cherryland Academy Awards haven't been handed out yet... until now. We have our own Oscars to hand out. These are handed out in any category we see fit. They run the gamut from greatest inventions to greatest rock 'n' roll band to greatest TV western. So without any further ado, here we go.

GREATEST INVENTION: The nominees – **1.** The Lightbulb. **2.** The Automobile. **3.** Flush Toilets. **4.** Television. **5.** The Internet. Critic's Choice: The Lightbulb.

And the Oscar goes to... *Flush Toilets* in an upset. If you've ever been "rustic" camping or been caught without electricity, you know I'm right.

Nick Edson

BEST ACTOR: **1.** Don Knotts; **2.** Red Green. **3.** Chevy Chase. **4.** Marlon Brando. **5.** Marlin Perkins. Critic's Choice: Marlon Brando.

And the Oscar goes to... *Don Knotts*. Versatility was the tie-breaker. From playing Barney Fife to *The Incredible Mr. Limpet* to the landlord Mr. Furley on *Three's Company*, Mr. Knotts was a scene stealer. An easy choice.

MOST POPULAR HOLLYWOOD PERSON (Non-Talent Category): **1.** Kim Kardashian; **2.** Paris Hilton. **3.** Nicole Richie; **4.** Khloe Kardashian. **5.** Snooki (don't ask). Critic's Choice: Whatever.

And the Oscar goes to... *Kim Kardashian*. Like, whatever.

MOST POPULAR HOLLYWOOD PERSON (Talent Category): **1.** Zoey Deschanel; **2.** George Clooney; **3.** Kristin Chenoweth; **4.** Meryl Streep; **5.** Emma Stone. Critic's Choice: Meryl Streep – she does win everything, you know.

And the Oscar goes to: *Kristin Chenoweth*. She sings the National Anthem with meaning; outstanding stage, TV and movie actress. Dynamic.

MOST POPULAR DETROIT

ATHLETE: **1.** Nicklas Lidstrom, Red Wings; **2.** Prince Fielder, Tigers; **3.** Justin Verlander, Tigers; **4.** Calvin Johnson, Lions; **5.** Matthew Stafford, Lions. Critic's Choice: Ben Wallace, Pistons. (Must be a Lifetime Achievement Award).

And the Oscar goes to: *Prince Fielder*. A no-brainer. Prince is golden until the season starts.

MOST DISLIKED NATIONAL ATHLETE:

1. Kris Humphries (Kardashian); **2.** Tiger Woods (also got votes for most admired); **3.** Kobe Bryant (All rise...); **4.** John Daly (One step forward, two steps back); **5.** Mike Tyson (from feared to pitied). Critic's Choice: Kris Who?

And the Oscar goes to: *Kobe Bryant*. It's all about you all the time.

BEST 1960s TV SITCOM: **1.** "My Three Sons"; **2.** "Andy of Mayberry"; **3.** "I Dream of Jeannie"; **4.** "Bewitched"; **5.** "Lassie." Critic's Choice: The Hollywood Foreign Press went for Jeannie, especially the French.

And the Oscar goes to... *"My Three Sons"*

in an upset over "Andy of Mayberry." (I know, I know. You thought because Don Knotts won for best actor that Andy of Mayberry was winning this category. I'm not a one-trick pony. Give me Fred MacMurray and the boys for a good laugh.)

BEST 1960s TV WESTERN: **1.** "Gunsmoke"; **2.** "Bonanza"; **3.** "Paladin"; **4.** "Rifleman"; **5.** "Rawhide". Critic's Choice: They went for a tie between Chuck Connors as "The Rifleman," just because Connors used to play first base for the Dodgers. And they went with "Rawhide," because Clint Eastwood was one of the stars.

And the Oscar goes to... "Bonanza," are you kidding? "Gunsmoke" was a close second. And if Matthew would have had the guts to marry Miss Kitty, or even ask her out on a date, they would have won.

GREATEST ROCK 'N' ROLL BAND: **1.** Rolling Stones; **2.** Dave Clark Five; **3.** The Beatles; **4.** Moody Blues; **5.** The Monkees. Critic's Choice: Moody Blues, with The Monkees a close second. (See why people don't listen to the critics?)

And the Oscar goes to... *The Beatles*. Are you kidding? Nobody else really had a chance. Okay, the Stones really did make a good run at the Boys From Liverpool.

Thanks for your attention. The statues will be mailed before the next Leap Year.

POWER SUPPLY UPDATE

Focus Shifts for WCEV

Wolverine Power Cooperative plans to continue development of the Wolverine Clean Energy Venture (WCEV) near Rogers City in 2012, although work on the project is expected to be limited. “New emission rules passed by the U.S. Environmental Protection Agency (EPA) in December 2011 make construction of a new power plant extremely difficult for any utility in the country,” says Brian Warner, director of environmental services for Wolverine. “Equipment vendors we have talked with agree.”

Wolverine received an air quality permit for the WCEV project from the Michigan Department of Environment Quality (MDEQ) in June 2011. Under state and federal law, the co-op has 18 months from the permit issue date to commence construction.

Prior to the new EPA rules, Wolverine was in the process of preparing formal bid

A rendering of the Wolverine Clean Energy Venture power plant.

packages for key components of the project, including boilers, turbines and foundations. The cooperative expected to seek bids from potential vendors in early 2012.

“We have suspended the bid process for now and shifted our focus to legal defense of our air permit and monitoring of regulatory and political developments,” Warner says. “We

continue to believe the Rogers City site is a world-class location for electric generation.”

The WCEV, proposed by Wolverine in May 2006, would consist of two generating units, each capable of producing 300 megawatts of baseload electricity. Baseload units are typically operated 24 hours a day, seven days a week.

Baseload Opportunity in Marquette

Wolverine signed a letter of intent with We Energies in January 2012 to evaluate formation of a joint venture that could lead to environmental improvements at the We Energies power plant in Marquette and shared ownership of the facility.

The Marquette power plant has five units, each capable of generating approximately 85 megawatts of baseload electricity. The plant was built between 1974 and 1979 and is currently staffed with 170 full-time employees.

Wolverine and We Energies have started evaluating the technical, economic and regulatory feasibility of installing state-of-the-art emission controls on the units to meet environmental regulations.

“We expect our due diligence efforts at the plant to take about six months, during which time Wolverine and We Energies will also negotiate definitive agreements for the potential joint venture,” says Dan DeCoeur, vice president of power supply for Wolverine. “A decision on whether to proceed is expected

We Energies' Marquette power plant.

by summer 2012.”

If the joint venture moves forward, Wolverine could own up to 60 percent of the Marquette plant's output. Wolverine is considering a joint venture with We Energies as part of its continuing efforts to secure reliable

baseload power supply at a competitive price for its members.

We Energies serves more than 1.1 million electric customers in Wisconsin and the Upper Peninsula, and over 1 million natural gas customers in Wisconsin.

Creating a Sunny Spot

Q: *I have an old picture window I want to replace with a bow or bay window. My budget is tight. Which type is best and most efficient? Should I buy an entire unit or assemble one from individual windows?*

A: Bow and bay windows are an attractive and affordable way to create a sunny spot for plants, pets or people. While today's models are much more efficient than the large, single-pane picture windows common in older homes, there are several factors to consider when choosing one for your home.

Bow vs. Bay

A bow or bay window is sometimes called the "poor man's sunroom," because it can provide some sunroom benefits at a lower cost. But what's the difference between bow and bay windows?

A bow window is made of four or more

(five is most common) narrow window panels, often of the same width. Using more window panels creates a circular appearance, which many people find attractive. Often, only the two end windows can be opened, but you can order them so they all open.

By comparison, a bay window is made from just three window panels. The fixed center window is similar to a smaller picture window, with an unobstructed view of the outdoors. A bay window can provide more of a mini-sunroom feel because it extends further from the house wall, providing more space for plants or a bench seat.

Efficiency and Payback

Replacing an old picture window will increase efficiency and reduce utility bills, but don't make the decision based on efficiency alone. It will take many years of energy bill savings to pay back the entire cost.

In terms of energy efficiency and durability, there is not a significant difference between

The seat sections for bay or bow windows can have a layer of foam insulation to reduce heat loss and improve comfort for people and plants.

bow and bay windows. As with any replacement window style, the glass is the heart of the window. Select the most energy-efficient glass your budget will allow, even if it forces you to cut back on styling or trim options. At the very minimum, select double-pane glass with a low-emissivity coating and inert gas in the gap between the panes.

Unless you are very handy with tools, it is better to buy an entire unit designed as a bow or bay window. This costs a little more than assembling one from individual windows, but it will likely be stronger and more airtight.

Whichever model you choose, you will enjoy the comfort and energy efficiency of your new "sunny spot" for years to come.

If you have a question for Jim, please email jdulley@countrylines.com, or mail to James Dulley, Michigan Country Lines, 2859 W. Jolly Rd., Okemos, MI 48864. Be sure to let us know which electric co-op you receive service from.

Turn Your House Into A Power Plant. Save Up To \$500.

Just like trees, geothermal heating and cooling systems produce energy from the sun and the earth. Solar Flair

How to get the brightest benefits from solar accent, path, and task lighting.

Want to add some outside lighting pizzazz without installing wiring or impacting your electric bill? As prices for solar technology drop, many manufacturers are harnessing the sun to help consumers add solar “flair” outdoors. While solar lights aren’t typically as bright as traditional options, by keeping a few rules of thumb in mind you can get the brightest benefit from sun-powered lights.

What to Consider

Solar lighting takes many forms: stakes, lamp-posts, hanging jars, and more. But every unit follows the same basic principle: the mechanism generates and stores energy during the day, then releases it at night.

Each light includes a miniature solar panel, typically a four-cell array measuring 2-by-2 inches. On the inside of the light fixture, the solar panel attaches to a rechargeable battery, at least one light-emitting diode (LED), a controller board, and a photoresistor (light sensor) to manage when the light shines and when it recharges.

The U.S. Department of Energy (DOE) advises consumers to consider geographic and site-specific variables. Solar lights will only work if they receive about eight to 12

hours of sunlight a day. Fewer hours translates into fewer hours of yard light—shorter winter days typically result in a 30-50 percent output decline.

Avoid shade from shrubs, trees or buildings, and check the miniature solar panels periodically for bird droppings, leaves, insects or other debris that might block the sun. Not only does a lack of sun impact light output; receiving less sunlight than recommended can shorten the battery life, too.

Before buying solar lights, think about the need it will fill. There are three different types of outdoor lights: accent, path, and task lights.

Accents

Accent lights add a glow to a landscape, but do not illuminate spaces well. Offering a lower light output, they’re generally more affordable than other solar options.

Search for solar lighting on Etsy.com, a popular online handmade marketplace, and on any given day almost 200 options appear. Creative recyclers use Mason jars, soft drink bottles, lamp bases, bird cages, and other lidded antiques to house the light. The fixture’s base doesn’t matter—interchangeable lids contain the solar array and bulb.

Accent lights can be colorful—online retailers like Earthtech Products offer illuminated glass-blown bulbs or stylized glass flowers. Amber LEDs are often used as an alternative to white, casting a softer glow but still revealing only a limited amount of area outside the light.

Consider using accent lights to mark hazards (stones, low walls) or as part of a garden feature, but do not rely on them for visual aid at night.

Path Lighting

Solar lights fill an important role for path lighting. Commonly sold in sets of four or eight, they often come with stakes or hanging hooks

to be placed along a path or driveway.

Path lights focus light downward and typically illuminate an area up to 20 feet away from the base, depending on the light strength. Some sets offer automatic on/off settings triggered by outside light; others include a six-hour or 10-hour setting. An on/off switch may also be included, allowing owners to soak in the sun for several days, then turn the lights on for a special nighttime event.

Suspended lights are not the only option; manufacturers like HomeBrite Solar produce stepping-stone solar lights, with styles that blend in with the environment.

Task Lighting

The sun also fuels practical outdoor lighting needs like floodlights and security motion sensors. These generally provide high light output—though not as bright as traditional spotlights—and are more expensive than other solar options.

Solar lampposts from manufacturers like Gama Sonic offer between eight and 10 hours of light with an output equivalent to 450 lumens (40 watts). Security lights are often ready-to-mount on a wall, but be sure the building or trees do not block the solar array. Some models have the solar array separate from the light to allow for prime sun placement.

Practical Matters

Although LEDs work well in cold temperatures, consider bringing accent and path lighting solar fixtures inside during harsh weather (freezing temperatures, heavy downpours, etc.). All outdoor solar lighting should be water resistant, but task lighting tends to be hardy and can withstand fiercer weather. And, while it’s fun to bring some solar flair inside for parties, remember to put them back outside to charge—leaving a solar jar on a windowsill will not work due to UV protection films and overhangs on many windows.

Read user reviews before buying a product. Some solar lighting sets may not last long, and the DOE advises consumers to make sure replacement bulbs and batteries are available. A variety of options are available at stores like Target, Home Depot, Lowe’s, and several online retailers. To learn more about these and other lighting options, visit energysavers.gov/lighting.

Use Portable Electric Generators Safely

Portable electric generators can offer many benefits when a long-term electrical outage occurs. However, if generators are not used properly, things could turn deadly.

After Hurricane Katrina, for example, many people relied on generators. But the misuse of them caused five deaths, according to the Centers for Disease Control and Prevention (CDC). The CDC also reported 51 cases of carbon monoxide poisoning.

Follow these tips for the safe use of your generator:

- ▲ Follow the manufacturers' directions for installation and operation.
- ▲ To prevent electric shock, make sure your generator is properly grounded. The operation manual should provide correct grounding procedures.
- ▲ Use it only in a well-ventilated and dry area located away from air intakes to the house. Do not use it in an attached garage.

▲ Operate this or other fuel-powered machines outside, where deadly carbon monoxide fumes cannot enter the home.

▲ Do not overload the generator by operating more appliances and equipment than it can handle. The operating instructions should list an output rating.

▲ Individual appliances should be plugged directly into the generator's receptacle outlet using appropriately-sized extension cords to carry the electric load. Make sure the cords are rated for outdoor use, have a grounded, three-pronged plug, and are in good condition.

- ▲ Do not run extension cords under rugs.
- ▲ *Never* connect generators directly to your home's wiring. The reverse flow of electricity can electrocute an unsuspecting utility worker.
- ▲ *Never* plug a generator into a household outlet.
- ▲ Only store fuel outside of living areas

and away from heat sources, such as water heater pilot lights.

- ▲ Do not refuel while it is running.
- ▲ Turn off all equipment powered by the generator before shutting it down.
- ▲ Keep children and pets away.

– Chris Grammes

Stay Clear!

A downed power line may not be a dead line. It could cause serious injury or death.

Follow these tips from your electric cooperative to stay safe:

- ▶ **Assume all power lines are energized and dangerous.** Even lines that are de-energized could become energized at any time.
- ▶ **Never touch a downed power line!** And never touch a person or object that is touching a power line.
- ▶ **If someone is injured as a result of contact with electric current, do not try to assist him or her.** You could be injured or killed. Call 911.
- ▶ **If a power line falls across your vehicle while you are in it, stay inside until help arrives.**
- ▶ **Call 9-1-1 immediately to report a downed power line.** Then call your electric cooperative.

The Old Man and The Ski

Ed Harjala turns 90 years old this month, but that isn't keeping him from entering his 20th cross-country ski race.

Photo Courtesy - Harjala Family

What would life be like without a hero? I don't know because I've had a few. I met one of my heroes over a decade ago. I watched this unimposing cross-country skier munching on a Pasty in Calumet, MI, after the Great Bear Chase Ski Race. I knew I had to meet him and worked up the courage to go to his table. We are friends now and he is still my hero.

Ed Harjala was 75 years old in 1998 when he lined up for the American Birkebeiner Ski Race, a thirty-one mile venture through the torturous hills of Northwest Wisconsin. By mid-race he was averaging over ten miles an hour and on pace to break three hours for the marathon. That's three hours at age 75.

As fate would have it, Ed collided with a fallen skier and subsequently, a tree. His arm splintered in several places and he has a permanent plate of steel in the region as a reminder. He didn't get his sub-3-hour Berkie. He didn't stop skiing either. A few days later, he was back on the skating tracks at the SwedeTown Trails in Calumet, near his hometown of Copper City in Michigan's Upper Peninsula. He adjusted by using one pole and letting his wounded arm hang at his side. His wife, Dots, (Dorothy), drove him to the trails.

Ed is 89 years old now. He's slowed down some but, after all, he's not 75 anymore. At 75, he would ski 25 kilometers daily. He was still doing that a handful of winters ago. Now he deals with heart issues and a foot that doesn't serve him the way it once did. But he's still a master of enthusiasm and artful skiing. He's "The Old Man and the Ski." Sorry,

Hemingway, this guy has earned the title.

"When I was young, in my 70s, I would roller-ski 2,000 miles each summer," Ed says. "Two years ago I was still roller skiing 700 miles a summer. Anyway, roller skiing is too easy."

Ed was also doing two hour workouts rowing his wooden pram near his cottage on Lake Superior. He would row along shore one way for an hour (1,600 strokes). Then he would turn back and head for home.

At age 87, Ed was out on one of his morning roller-ski workouts when he spotted a patch on the highway ahead of him that looked to be new cement. As he got closer he realized that it was a slick from spilled cooking oil, (UP bear bait). Ed couldn't stop, slid onto the slick, and fell on his shoulder, wrenching it badly. "Just lucky I had a leather elbow patch on my shirt, to repair a tear, or my elbow would have been skinned up pretty good too."

Twenty years earlier, at the age of 67, Ed was still in wave 1 at the Berkie. "At (age 85), I was in Wave 3," Ed says. "Now I'm in Wave 9. I'm just moving now." Just moving now? Tell that to the other 89 year-olds on the planet.

Ed's last long Berkie was in 2006. His lungs don't quite give him the lift they once did. He also strides now instead of skating because, "Striding feels easier."

He has entered the Kortolopet these past years, the Berkie's 23 kilometer event. He missed last year's event.

Ed has completed 19 Berkies and needs one more to qualify for the commemorative 'Birch Leggings' bib given to those who finish

20 full Berkies. He told Berkie officials that his body just wouldn't allow him to complete that 20th race. In appreciation for the enthusiasm he has brought to the sport of cross-country skiing, officials sent him the 20-year commemorative bib anyway.

There have also been times, not that long ago, that Ed, thirsting for more competition, asked to be placed in a younger wave bracket at the Berkie. Up to recently, the last competitive age group category has been 80 years and over. In honor of Ed's contribution to the sport, they now have an 85 year old category.

Ed and Dots volunteer at the chalet at Swedetown Trails every Thursday afternoon, serving skiers items like coffee, hot chocolate, and U.P. pasties. They have been the poster couple for the local 'Ski for Hearts' fundraiser. When visiting the chalet, be sure to look up on the wall at Ed's 20-year commemorative Berkie bib, a tribute to a man who, in his way, has made the art of putting on skis a little easier for all of us. You'll also see at least one of his state-of-the-art collapsible wooden waxing stations in the complex. Ed is still in full stride, making them for anyone who needs one. Ed is also an accomplished mason, electrician, fisherman, and still makes his own firewood.

Ed, the oldest skier at Swedetown Trails, would like to compete in the shorter version of the track's Great Bear Chase, this March. The race is 26 kilometers in length. He'll be careful of the mass of skis and poles at the start. He'll pace himself so he doesn't tire early. He'll sense the old mining shafts and other remnants of a past Upper Michigan mining era as he skis with the enthusiasm of a child. Then he'll hear his name called and see people clapping at the finish. The giant digital clock will tell him that he is well within the reach of his goal. Then, with one last push of his poles, he'll cross the finish line, thrilled that he can still challenge himself at the age of 90. The public address announcer might even say something like, "Now finishing is Ed Harjala, a work in progress, The Old Man and the Ski."

My life was just beginning when Ed was overseas during World War II. I never even met him until he was in his late 70s. We have known each other on a limited basis since then. I think of him every time I wax my skis on the ski station he made me. I think of how he taught me to give life its best shot and enjoy every minute of it.

STUDENTS!

WIN A TRIP TO WASHINGTON, D.C.

Are you a leader? If you're a high school sophomore or junior who will be 16 or 17 by June 2012, and your family receives electric service from Cherryland Electric Cooperative, you may be eligible to attend the **FREE** co-op-sponsored Youth Leadership Summit.

The fun takes place April 18-20 at the 4-H Kettunen Center near Cadillac. You'll join students from other Michigan electric co-ops for a unique, high-energy experience to help you develop leadership skills and explore career opportunities in the electric industry. Plus, you'll get a chance to learn more about your electric co-op, and even try climbing a utility pole in full lineworker gear. Students chosen to attend the YLS will automatically be considered for a **FREE** trip to Washington, D.C., June 16-21, as part of the Rural Electric Youth Tour.

Apply online or download an application at **CherrylandElectric.com**. For more information, call Amanda Olds at 231-486-9254 or email aolds@cecelec.com. Applications are due by **March 21, 2012**.
